Natl. Acad. Sci. U.S.A. 99:16899-16903 (2002).
-!- FUNCTION: Cytokine that binds to INFRSF7/CD27. Plays a role in T cell activation. Induces the proliferation of costimulated T cells and enhances the generation of cytolytic T cells.
-!- SUBGNIT: Homotrimer (Probable).
-!- SUBCELLULAR LOCATION: Type II membrane protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       P32970; Q96J57;

Dear T.N., Matena K., Vingron M., Boehm T.;

"A new subfamily of vertebrate calpains lacking a calmodulin-like domain: implications for calpain regulation and evolution.";

Genomics 45:175-184(1997).

-! CATALYTIC ACTIVITY: Broad endopeptidase specificity.

-! TISSUB SPECIFICITY: Expressed in many tissues.

-! SIMILARITY: Contains 1 C2 domain.

-! SIMILARITY: Contains 1 calpain catalytic domain.

"The axonal glycoprotein TAG-1 is an immunoglobulin superfamily member with neurite outgrowth-promoting activity.";
Cell 61:157-170(1990).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       -:- FUNCTION: May play a role in the initial growth and guidance of axons. May be involved in cell adhesion.
-:- SUBCELIULAR LOCATION: Attached to the neuronal membrane by a GPI-anchor and is also released from neurons.
-:- TISSUB SPECIFICITY: In neural tissues in embryos, and in adult brain, spinal cord and cerebellum.
-:- DEVELOPMENTAL STAGE: Transiently expressed on a subset of axons in the developing rat nervous system.
-:- SIMILARITY: Contains 4 fibronectin type III domains.
-:- SIMILARITY: Contains 6 immunoglobulin-like C2-type domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Bukaryota, Metazoa, Chordata, Craniata, Vertebrata, Buteleostomi,

The invention provides ligands that bind specifically to a region of an animal cell polymeric immunoglobulin receptor (pIGR). The pIGR cleaves to produce a stalk region remaining attached to the cell and a secretory component existing in the organ of interest in several forms. The ligands on the bind to the stalk or the most abundant form of the secretory component present in the organ under physiological conditions. The ligands are useful for transporting therapeutic or diagnostic compositions into or across cells expressing pIGR, useful to introduce or transport ligands such as antibodies and/or to deliver biologically compositions into or across cells expressing pIGR, useful to introduce or transport ligands such as proteins, nucleic acids or detectable labels. They are used to deliver therapeutic compositions to mucosal surfaces such as the gastro-intestinal tract, respiratory system etc. in humans. They are also useful to label cells expressing pIGR, e.g. to distinguish epithelial cells from a mixed cell population in pathology studies or to aid in carcinoma diagnosis (since pIGR expression is reduced in carcinomas relative to normal epithelium). They can also be used to deliver veterinary compositions, especially in mammals such as farm, domestic or wild mammals or birds e.g. birds reared for human consumption. Sequences AAG65704-710 represent specific examples of pIGR peptide epitopes to which the ligands of the invention bind to
                                                                                                                                                                                                                                                                                                                    New ligands binding to a specific region of a polymeric immunoglobulin receptor, useful for transporting therapeutic or diagnostic compositions into or across cells expressing pIGR e.g. in drug delivery.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

```
The invention described a complex or compound (I) comprising a biologically active portion and a target element (II) directed to a ligand that confers transcellular, transcribtic or paracellular transcribtic or paracellular transcribtic or paracellular transporting properties to an agent specifically bound to the ligand, where (II) is not an antibody. Alternatively, (I) comprises two or more ligands. (I) is useful for delivering as to biologically active agent to an animal, for transporting an active agent through an epithelial or mucosal barrier, and for treating or identifying through an animal e.g. diseases of the respiratory system including lung cancer and tumours, asthma, pathogenic infections, allergy related disorders, gastrointestinal tract disorders, disorders and any gastrointestinal hormones, Chron's disease, eating disorders and any disease or disorder and any clisses or disorder and any clisses or disorder and any clisses or disorder involving polyimmunoglobulin receptor (pIgN) transport of biologically active agents across cellular barriers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        lung disease; targeting element; apical; basolateral; transcytosis; in vitro transcytotic assay; antimicrobial; antitubercular; tuberculostatic, virucide; fungicide; antiinflammatory; respiratory-Gen; antiasthmatic; respiratory tract infection; lung infection; bacterial infection; tuberculosis; viral infection; infection; esever acute respiratory syndrome; SARS; fungal infection; pneumonia; interstitum disorder; gas exchange disorder; blood circulation disorder; airway disease; pleura disorder; Chronic Obstructive Pulmonary Disorder;
                                                                                                                                        Complex useful for transporting active agent through epithelial barrier, has biologically active portion and target element directed to ligand that confers e.g. transcytotic properties to agent specific to ligand.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               셤
                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method of identifying biologically active small molecules that specifically bind a transcytotic molecule or a copyimmunoglobulin receptor (FigR) target molecule. The method involves contacting candidate small molecules with at least 1 transcytoric contacting candidate small molecules with at least 1 transcytoric comprising the transcytoric molecule or pigR target molecule and a small complexes. The methods and compositions of the present invention are used complexes. The methods and compositions of the present invention are used for identifying, characterising, distinguishing, derivatishing, optimising and using compounds that are or comprise a ligand that binds a pigR molecule used for therapeutic and prophylactic applications, particularly in vaccination and in diseases where a protective immune response is needed or in diseases such as cancer, asthma, pathogenic infections, allergies, Crohn's disease and eating disorders. The present sequence is a peptide epitope used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                         Identifying small molecules that specifically bind a transcytotic or pIgR target molecule, useful for treating and/or preventing disorders such as cancer, asthma, pathogenic infections, allergies and Crohn's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

This invention relates to a novel method of treating or preventing a lung disease in a subject which comprises administering to the subject via a pulmonary, oropharyngeal or nasopharyngeal route a compound comprising a therapeutic agent and a targeting element directed to a ligand, where the targeting element confers apical to basolateral transcycosis to the therapeutic agent in an in vitro transcytotic assay. The therapeutic agent in an in vitro transcytotic, a mittubercular, tuberculostatic, virucide, fungicide, antinifammatory, respiratory-Gen treating or preventing a lung disease, for example a respiratory tract infection, an infection of the lung, or a bacterial infection that causes tuberculosis, a viral infection that causes spondrome (SARS), fungal infection that causes spondrome (SARS), fungal infection, causes pneumonia, a disorder of the interstitium, a disorder of gas exchange or blood circulation, a disease interstitium, a disorder of the pleura, Chronic Obstructive Pulmonary Disorder (COPD) or asthma. The present sequence is that of a peptide which may be used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                  Treating or preventing a lung disease comprises administering to the subject a compound comprising a therapeutic agent and a targeting element
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New ligands binding to a specific region of a polymeric immunoglobulin receptor, useful for transporting therapeutic or diagnostic compositions into or across cells expressing pigR e.g. in drug delivery.

The invention provides ligands that bind specifically to a region of an animal cell polymeric immunoglobulin receptor (pIGR). The pIGR cleaves to produce a stalk region remaining attached to the cell and a secretory component existing in the organ of interest in several forms. The ligands of the stalk or transporting therapeutic or diagnostic component present in the organ under physiological conditions. The ligands are useful for transporting therapeutic or diagnostic compositions into or across cells expressing pIGR, useful to introduce or transport ligands such as antibodies and/or to deliver biologically compositions into or across cells expressing pIGR, useful to introduce or transport ligands such as antibodies and/or to deliver biologically active components such as proteins, nucleic acids or detectable labels. They are used to deliver therapeutic compositions to mucosal surfaces such as the gastro-intestinal tract, respiratory system etc. in humans. They are also useful to label cells expressing pIGR, e.g. to distinguish epithelial cells from a mixed cell population in pathology studies or to aid in carcinomas relative to normal epithelium). They can also be used to deliver therapeutic cannon also be used to deliver veterinary compositions, especially in mammals such as farm, domestic or wild mammals or birds e.g. birds reared for human consumption. Sequences AAG65704-710 represent specific examples of pIGR peptide epitopes to which the ligands of the invention bind to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Complex useful for transporting active agent through epithelial barrier, has biologically active portion and target element directed to ligand that confers e.g. transcytotic properties to agent specific to ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         paracellular transport;

The invention described a complex or compound (I) comprising a biologically active portion and a target element (II) directed to a ligand that confers transcellular, transcyctic or paracellular transcyctic or paracellular transporting properties to an agent specifically bound to the ligand, where (II) is not an antibody. Alternatively, (I) comprises two or more (II) is not an antibody. Alternatively, (I) comprises two or more biologically active agent to an animal, for transporting an active agent through an epithelial or mucosal barrier, and for treating or identifying a disease in an animal e.g. diseases of the respiratory system including lung cancer and tumours, asthma, pathogenic infections, allergy-related disorders, gastrointestinal tract disorders, disorders relating to gastrointestinal hormones, Chrow's disease, eating disorders and any disease or disorder involving polyimmunoglobulin receptor (pIGR) is displaying cells. This sequence represents a peptide associated with the transport of biologically active agents across cellular barriers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a human polyimmunoglobulin receptor peptide fragment which is used in a method involving the construction of a target molecule from human J chain protein fragments. This construct is used in a method to target imaging agents to epithelial surfaces at which they may remain or undergo transcapthelial transport via transcytosis. At least one imaging agent is linked to the targeting molecule comprising a polypeptide that (a) forms a closed covalent loop, (b) contains at least 3, preferably 4, peptide domains having beta-sheet character separated by domains lacking beta-sheet character and (c) is not full length dimeric IgA. The imaging agents are useful in the diagnosis of disease. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Target; imaging agent; epithelium; transepithelial transport; diagnosis; transcytosis; disease; basolateral; internalisation; J chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     epithelial tissue targetting agent - used to deliver imaging agents in epithelial surface for internalisation; useful in diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human polyimmunoglobulin receptor peptide fragment (aa 585-600).

The polyimmunoglobulin receptor sequence is used in the synthesis of a targeting molecule (TM). The TMs are used to target biological agents to epithelial surfaces at which they can be internalised. The TMs comprise a polypeptide that: (a) forms a closed covalent loop; (b) contains at least domains lacking beta-sheet character; and (c) is not full length dimeric IgA. The TMs are useful to prevent and/or treat diseases associated with epithelial surfaces, e.g. asthma, cancer, (myco)bacterial, viral or epithelial surfaces, inflammatory disorders, autoimmune disorders, celiac disease, colitis, pneumonia and cystic fibrosis
target molecule is also capable of specifically binding to a basolateral factor associated with an epithelial surface to cause internalisation of a biological agent linked to the target molecule
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New epithelial tissue targetting agent - used to deliver biologically active compounds to an epithelial surface for internalisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gapa

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A targeting agent for improving the delivery of drugs to target cells, particularly for delivery of enzymes, binding agents, inhibitors, nucleic acids, carbohydrates and lipids, is new. The targeting agent comprises a polypeptide which forms a closed covalent loop and contains at least three peptide domains having beta-sheet character, each of the domains being separated by domains lacking beta-sheet character. The targeting molecule preferably comprises all or a portion of a native J chain sequence. J chain is a 15 kD protein that, in vivo, links IgM or IgA monomers to form pentameric IgM or dimeric IgA. The polypeptide is linked to at least one biological agent which is capable of entering and killing a non-polarised epithelial cell. The targeting molecule may be linked to the biological agent by a substract for an intracellular or extracellular enzyme which is associated with or secreted by the non-polarised target cell. The targeting molecule can be used in a pharmaceutical composition cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             for treating a patient afflicted with a disease associated with non-polarised epithelial cells, especially cancer e.g non-small cell lung carcinoma, breast carcinoma, colon carcinoma, ovarian carcinoma, prostate carcinoma and endometriosis, viral infection or inflammatory disorders. This polyimmunoglobulin receptor sequence may be attached to the N-terminal ends of the targeting molecules described
                                                                                                                          Targeting molecule; J chain; immunoglobulin; IgM; IgA; substrate; epithelial cell; cancer; treatment; therapy; non-small cell lung carcinoma; carcinoma; colon carcinoma; ovarian carcinoma; prostate carcinoma; endometriosis; viral infection;
                                                                                                                                                                                                                                                                                                                                                                                                                                   Targeting molecule useful in drug delivery for treating cancer, viral infection or inflammatory disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a new targeting molecule linked to at least one enzyme inhibitor, where the targeting molecule is a J chain or lits portion that specifically binds to an epithelial basolateral factor such that the targeting molecule linked to the enzyme inhibitor is capable of entering and killing a non-polarised epithelial (NPE) cell. The invention is useful for delivering an enzyme inhibitor into NPE cells of a patient afflicted with a disease associated with NPE cells. The patient is afflicted with cancer (endometriosis, non-small cell lung carcinoma, or breast, colon, ovarian or prostate carcinoma), viral infection or inflammatory disorders. The invention is also useful for treating and inhibiting the development in a patient of a disease associated with NPE cells. The present amino acid sequence represents a human peptide, as described in the methods of the invention
                                                       Targeting molecule, TM; enzyme inhibitor; epithelial basolateral factor; d'châin; non-polarised epithelial cell; NPB; cancer; endometrisosis; non-small cell lung carcinoma; breast carcinoma; inflammatory disorder; ovarian carcinoma; prostate carcinoma; viral infection; colon carcinoma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New targeting molecule useful for delivering enzyme inhibitor into non-polarized epithelial cells of patient afflicted with disease associated with non-polarized epithelial cells, linked to enzyme inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Targeting molecule; carcinoma; cancer; TM; infection; viral; bacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                          This invention relates to the DNA and protein sequences of a targeting molecule, comprising a polypeptide that forms a closed covalent loop linked to at least one imaging agent linked to a peptide sequence that delivers the imaging agent to a carcinoma cell, nucleus or endoplasmic reticulum. The targeting molecules of the invention are used for in vivo diagnosis (imaging) of diseases, particularly cancer but may also be used for bacterial or viral infections. The targeting molecules of the invention are targeted specifically to epithelial cells, so may be used to improve diagnosis of inciplent tumours. The present sequence represents an peptide sequence used to create the targeting molecule of
                                                                                                                  New targeting agent, useful for in vivo diagnosis of cancer, comprises closed loop peptide linked to imaging agent directed specifically to epithelial surfaces.
                                                                                                                                                                                                                                                                                                                                 Gaps

```
This invention relates to a novel targeting molecule capable of specifically binding to a basolateral factor associated with an espithelial surface and causing the internalisation of an imaging agent linked with it, where the targeting molecule is not full length dimeric IgA. Imaging agents linked to a targeting molecule by a substrate for an intracellular or extracellular enzyme associated with the epithelial barrier are transported through the epithelial barrier and do not remain associated with the basolateral domain. The present sequence is that of a polyimmunoglobulin receptor protein which is related to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Transcellular transport; transcytotic transport; paracellular transport; respiratory system disorder; lung cancer; tumour; asthma; apathogenic infection; allergy-related disorder; gastrointestinal tract disorder; gastrointestinal hormone disorder; chron's disease; eating disorder; polyimmunoglobulin receptor; plgR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Complex useful for transporting active agent through epithelial barrier, has biologically active portion and target element directed to ligand that confers e.g. transcytotic properties to agent specific to ligand.
molecule that binds to a basolateral factor associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention described a complex or compound (I) comprising a biologically active portion and a target element (II) directed to a ligand that confers transcellular, transcytotic or paracellular transporting properties to an agent specifically bound to the ligand,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                             surface and causes internalization of imaging agent useful for delivering imaging agents to epithelial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ä

ö
where (II) is not an antibody. Alternatively, (I) comprises two or more biglands. (I) is useful for delivering a biologically active agent to an animal, for transporting an active agent to an animal, for transporting an active agent to mucosal barrier, and for treating or identifying a disease in an animal e.g. diseases of the respiratory system including lung cancer and tumours, asthma, pathogenic infections, allergy-related disorders, gastrointestinal tract disorders, disorders relating to gastrointestinal hormones, Chron's disease, eating disorders and any disease or disorder involving polyimmunoglobulin receptor (pIGR) displaying cells. This sequence represents a spetide associated with the transport of biologically active agents across cellular barriers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention described a complex or compound (I) comprising a biologically active portion and a target element (II) directed to a biologically active portion and a target element (II) directed to a transporting properties to an agent specifically bound to the ligand, where (II) is not an antibody. Alternatively, (I) comprises two or more (II) directed to one or more ligands. (I) is useful for delivering a biologically active agent to an animal, for transporting an active agent through an epithelial or mucosal barrier, and for treating or identifying a disease in an animal e.g. diseases of the respiratory system including

(I) is useful for delivering a biologically active agent to an animal, for transporting an active agent through an epithelial or mucosal barrier, and for treating or identifying a disease in an animal e.g. diseases of the respiratory system including lung cancer and tumours, asthma, pathogenic infections, allergy-related disorders, gastrointestinal tract disorders, disorders relating to disease or disorder involving polyimmunoglobulin receptor (pigs) displaying cells. This sequence represents a peptide associated with the
                                                                         with the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Transcellular transport; transcytotic transport; paracellular transport;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Complex useful for transporting active agent through epithelial barrier, has biologically active portion and target element directed to ligand that confers e.g. transcytotic properties to agent specific to ligand.
cancer and tumours, asthma, pathogenic infections, allergy-related
             disorders, gastrointestinal tract disorders, disorders relating to gastrointestinal hormones, Chron's disease, eating disorders and any disease or disorder involving polylmmunoglobulin receptor (PIGR) displaying cells. The stalk is the extracellular component of the pigR that is bound to the cell following cleavage of the secretory component of the pigR. The stalk is present regardless of whether the secretory component segment is cleaved or uncleaved from pigR. A ligand, preferably a humanised antibody or a creombinant single chain variable region fragment can specifically bind to the stalk of a pigR of a cell under physiological conditions, but not to the secretory component of pigR. Such a ligand can be introduced into continue a pigR by attaching to the stalk of the pigR. The size coll and can be used to target to, into or across the apical or basolateral surface of a mammalian epithelial cell, a biologically active component confinence in the cell and the wild type cystic fibrosis transmembrane conductance regulator, protein, radioisotope, lipid or carbohydrate. The biologically active composition can also be cellected from a proup consisting of anti-inflammatories, antisense.

This peptide sequence represents the stalk of the polymeric immunoglobulin receptor (pigR) to which a ligand can bind to. The stalk is the extracellular component of the pigR that is bound to the cell following cleavage of the secretory component of the pigR. The stalk is present regardless of whether the secretory component segment is cleaved or uncleaved from pigR. A ligand, preferably a humanised antibody or a cecombinant single chain variable region fragment can specifically bind to the stalk of a pigR of a cell under physiological conditions, but not to the secretory component of pigR. Such a ligand can be introduced into a cell expressing a pigR by attaching to the stalk of the pigR. The ligand can be used to target to, into or across the apical or basolateral surface of a mammalian epithelial cell, a biologically active component selected from a nucleic acid (preferably encoding the wild type cystic fibrosis transmembrane conductance regulator), protein, radiolostope, lipid or carbohydrate. The biologically active composition can also be selected from a group consisting of anti-inflammatories, antisense oligonucleotides, antibiotics or anti-infectives
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ligand that binds the stalk of a cell's polymeric immunoglobulin receptor - useful to target to, into or across mammalian epithelial cell biologically active component, e.g. nucleic acid, protein, lipid,

                                                                                                                                                                                                                                                                                                                                                                                                                              The invention provides ligands that bind specifically to a region of an animal cell polymeric immunoglobulin receptor (pigR). The pigR cleaves to produce a stalk region remaining attached to the cell and a secretory component existing in the organ of interest in several forms. The ligands do not bind to the stalk or the most abundant form of the secretory component present in the organ under physiological conditions. The ligands are useful for transporting therapeutic or diagnostic compositions into or across cells expressing pigR, useful to introduce or transport ligands such as antibodies and/or to deliver biologically active components such as proteins, nucleic acids or detectable labels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                They are used to deliver therapeutic compositions to mucosal surfaces such as the gastro-intestinal tract, respiratory system etc. in humans. They are also useful to label cells expressing pigk, e.g. to distinguish epithelial cells from a mixed cell population in pathology studies or to aid in carcinoma diagnosis (since pigk expression is reduced in carcinomas relative to normal epithelium). They can also be used to deliver veterinary compositions, especially in mammals such as farm, domestic or wild mammals or birds e.g. birds reared for human consumption. The present sequence represents a human pigk fragment
                                                                                                                                                                                                                                                                                                                                                      New ligands binding to a specific region of a polymeric immunoglobulin receptor, useful for transporting therapeutic or diagnostic compositions into or across cells expressing plgR e.g. in drug delivery.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The present invention describes a fusion protein (I) comprising a transepithelial delivery element (TDE) from a first protein and a transembrane domain from a second protein, or comprising TDE and a viral conferent action of a virus. (I) has immunostimulant, sequence that confers the ability to be associated with or incorporated into an envelope or capsid protein of a virus. (I) has immunostimulant, confers the ability to undergo apical endocytosis, basolateral endocytosis, antinflammatory activities, and can be used in gene therapy. (I) confers the ability to undergo apical endocytosis, basolateral endocytosis, apical or basolateral endocytosis, apical or basolateral transcytosis, apical to basolateral transcytosis, packled severe combined immunodeficiency, ADA deficiency (ADA-SCID), cystic fibrosis, Haemophilia (Immunodeficiency, ADA deficiency (ADA-SCID), cystic fibrosis, Haemophilia (ALS), rheumatoid arthritis, pathogenic discorders, including human confermation arthritis, pathogenic discorders, including human (MALS), rheumatoid arthritis, pathogenic discorders, including human confercion, virus (HIV), viral infections, hepatitis, non-specific dastrointestinal ulcer. The present sequence represents and conference of polyimmunoglobulin receptor (FIGR) amino acid sequence which is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

Fusion protein which confers the ability to penetrate epithelial cell layer and to undergo paracellular transport, has a transepithelial delivery element and a transmembrane domain from different proteins.

Disclosure; Fig 2C; 160pp; English.

The present invention describes a fusion protein (I) comprising a transepithelial delivery element (TDE) from a first protein and a transepithelial delivery element (TDE) from a first protein and a transembrane domain from a second protein, or comprising TDE and a viral cequence that confers the ability to be associated with or incorporated into an envelope or capsid protein of a virus. (I) has immunostimulant, cytostatic, neuroprotective, antihemmatic, antiarthritic, antiulcer, antibacterial, anti-HIV, hepatotropic, virucide and antinflammatory activities, and can be used in gene therapy. (I) confers che ability to undergo apical endocytosis, basolateral endocytosis, apical or basolateral texocytosis. Diseases treatable by gene therapy concluded monogenic diseases such as X-linked severe combined immunodeficiency, ADA deficiency (ADA-SCID), cystic fibrosis, Haemophilia Cimmunodeficiency virus (HIV), viral infections, hepatitis, non-specific mannodeficiency virus (HIV), viral infections, hepatitis, non-specific construction infection, tuberculosis, Haepses, Chamychoids and control infection of the present sequence represents a control of the present invention

Fusion protein which confers the ability to penetrate epithelial cel layer and to undergo paracellular transport, has a transepithelial delivery element and a transmembrane domain from different proteins.

03-APR-2001; 2001US-0281275P.

(ARIZ-) ARIZEKE PHARM INC.

Sheridan PL, Houston LL; WPI; 2003-046923/04. Disclosure; Fig 2C; 160pp; English

The present invention describes a fusion protein (I) comprising a transepithelial delivery element (TDE) from a first protein and a transmembrane domain from a second protein, or comprising TDE and a viral sequence that confers the ability to be also ciated with or incorporated into an envelope or capsid protein of a virus. (I) has immunostimulant, cytostatic, haemostatic, neuroprotective, antirheumatic, antiatheritic, antitibacterial, anti-HIV, hepatotropic, virucide and antializer, attibacterial, and can be used in gene therapy. (I) confers the ability to undergo apical endocytosis, basolateral transcytosis and basolateral to apical transcytosis. Diseases treatable by gene therapy include monogenic diseases such as X-linked severe combined include monogenic diseases such as X-linked severe combined immunodeficiency, ADA deficiency (ADA-SCID), cystic fibrosis, Haemophilia (ALS), rheumatoid arthritis, pathogenic disorders, including human the monogenic disease, amyotrophic lateral sclerosis (ALS), rheumatoid arthritis, pathogenic disorders, including human gastrointestinal ulcer. The present sequence represents a polyimmunoglobulin receptor (FIGR) amino acid sequence which is given in the exemplification of the present invention

Sequence 94 AA;

```
The invention describes a multimeric molecular complex comprising at least 2 compounds, each of which has at least one targeting element least 2 compounds, each of which has at least one targeting element directed to a ligand that confecular complex specifically bound to the ligand. Also described are: a compound comprising at least 2 targeting elements directed to the ligand; a protein conjugate comprising a biologically active calcitonin polypeptide having a chemical linkage to at least one targeting element directed to the ligand; a pharmaceutical composition comprising the compound, delivering a biologically active agent to an animal; transporting a biologically active agent to an animal; transporting a biologically active agent to an animal. The complex is useful for preparing a composition for disagnosing or treating disease; ne so, osteoporosis, renal failure, colitis gastroenteritis, inflammatory bowel disease, psoriasis, allure, Alzehimer's disease, optic neuropathy or ophthalmoplegia. This sequence represents a polyimmunoglobulin receptor (plgs) stalk region consensus sequence that may be used in the creation of a fusion protein with

The invention describes a multimeric molecular complex comprising at least 2 compounds, each of which has at least one targeting element directed to a ligand that confers transcytotic or paracellular transporting properties to a molecular complex specifically bound to the ligand. Also described are: a compound comprising at least 2 targeting elements directed to the ligand; a protein comprising at least 2 targeting biologically active calcitonin polypeptide having a chemical linkage to at least one targeting element directed to the ligand; a pharmaceutical composition comprising the compound; delivering a biologically active agent to an animal; transporting a biologically active agent to an animal; treating a disease in an animal; and identifying a disease in an animal. The complex is useful for preparing a composition complex is useful for preparing a composition of disease in an animal in the complex is useful for preparing a composition conties, gastroenteritis, inflammatory bowel disease, psoriasis,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention describes a multimeric molecular complex comprising at least 2 compounds, each of which has at least one targeting element directed to a ligand that confers transproteit or paracellular transporting properties to a molecular complex specifically bound to the ligand. Also described are: a compound comprising at least 2 targeting belemente directed to the ligand; a protein conjugate comprising a biologically active calcitonin polypeptide having a chemical linkage to at least one targeting element directed to the ligand; a pharmaceutical composition comprising the compound; delivering a biologically active agent through an epithelial barrier; treating a disease in an animal; and identifying a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New multimeric molecular complex, useful for preparing a composition for diagnosing or treating e.g. osteoporosis, renal failure, colitis, gastroenteritis, inflammatory bowel disease, psoriasis or Alzheimer's
Alzheimer's disease, optic neuropathy or ophthalmoplegia. This sequence represents a polyimmunoglobulin receptor (pigR) stalk region that can be used in the creation of a fusion protein with glutathionine-S-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention comprises the amino acid and coding sequences of novel proteins. The DNA and protein sequences of the invention are useful as: markers for tissues in which the corresponding protein is preferentially expressed; as molecular weight markers on gels; as chromosome markers or tags; to identify chromosomes or to map related gene positions; and to compare with endogenous DNA sequences in patients to identify potential genetic disorders. The present amino acid sequence represents a protein of the invention.
             for diagnosing or treating diseases, e.g., osteoporosis, renal failure, colitis, gastroenteritis, inflammatory bowel disease, psoriasis, Alzheimer's disease, optic neuropathy or ophthalmoplegia. This sequence represents a polyimmunoglobulin receptor (pIgR) stalk region that can be used in the creation of a fusion protein with glutathionine-S-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             for tissues

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method of identifying biologically active small molecules that specifically bind a transcytotic molecule or a polyimmunoglobulin receptor (pIgN) target molecule. The method involves contacting candidate small molecules with at least 1 transcytotic molecule or at least one pIgN target molecule so that complexes molecule or at least one pIgN target molecule so that complexes of transcytotic molecule or pIgN target molecule and a small molecule can form, and identifying the small molecules present in the complexes. The methods and compositions of the present invention are used for identifying, characterising, distinguishing, derivatising, optimising and using compounds that are or comprise a ligand that binds a pIgN molecule used for therapeutic and prophylactic applications, particularly in vaccination and in diseases where a protective immune response is needed or in diseases such as cancer, asthma, pathogenic infections, allergies, Crohn's disease and eating disorders. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Identifying small molecules that specifically bind a transcytotic or pIgR target molecule, useful for treating and/or preventing disorders such as cancer, asthma, pathogenic infections, allergies and Crohn's disease.

The present invention describes a fusion protein (I) comprising a transepithelial delivery element (TDE) from a first protein and a transmembrane domain from a second protein, or comprising TDE and a viral sequence that confers the ability to be associated with or incorporated into an envelope or capsid protein of a virus. (I) has immunostimulant, cytostatic, haemoetatic, neuroprotective, antirheumatic, antiarthritic, antilnflammatory activities, and can be used in gene therapy. (I) confers the ability to undergo apical endocytosis, basolateral endocytosis, apical or basolateral exocytosis, apical to basolateral transcytosis and basolateral to apical transcytosis. Diseases treatable by gene therapy include monogenic diseases with as X-linked severe combined immunodeficiency, ADA deficiency (ADA-SCID), cystic fibrosis, Haemophilia immunodeficiency, ADA deficiency disease, cancers such as coronary artery disease, amyotrophic lateral sclerosis (ALS), rheumatoid arthritis, pathogenic diseases, including human immunodeficiency virus (HIV), viral infections, hepatitis, non-specific dasterial infection, tuberculosis, Heropers Chlamydiosis and casterinal ulcer. The present sequence represents a polyimmunoglobulin receptor (FIGR) amino acid sequence which is given in
                                                                                                                                                                             Transepithelial transport; membrane bound vesicle; virion; liposome; envelope; capsid; transmembrane domain; gene therapy; immunostimulant; cytostatic; haemostatic; neuroprotective; antichematic; antiarthritic; antiinflammatory; apical endocytosis; antiinflammatory; apical endocytosis; basolateral endocytosis; ADA-SCID; transcytosis; morgenic disease; ADA deficiency; cystic fibrosis; ADS; X-linked severe combined immunodeficiency; Hemophilia B; cancer; HIV; chronic granulomatous disease; coronary artery disease; viral infection; pathogenic disorder; huematoid arthritis; hepatitis; Herpes; pathogenic disorder; hueman immunodeficiency virus; bepatitis; Herpes; polyimmunoglobulin receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Fusion protein which confers the ability to penetrate epithelial cell layer and to undergo paracellular transport, has a transepithelial delivery element and a transmembrane domain from different proteins.
                                                                                                                                           Polyimmunoglobulin receptor (pIgR) amino acid sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /note= "X is unspecified"

The present invention describes a fusion protein (I) comprising a transepithelial delivery element (TDE) from a first protein and a transembrane domain from a second protein, or comprising TDE and a viral sequence that confers the ability to be associated with or incorporated into an envelope or capsid protein of a virus. (I) has immunostimulant, cytostatic, hameostatic, nationaric, antiharheumatic, antiarthritic, antiharmatory activities, and can be used in gene therapy. (I) confers the ability to undergo apical endocytosis, basolateral endocytosis, apical or basolateral endocytosis, basolateral transcytosis and basolateral to apical transcytosis. Diseases treatable by gene therapy include monogenic diseases such as X-linked severe combined immunodeficiency, ADA deficiency (ADA-SCID), cystic fibrosis, Haemophilia immunodeficiency and disease, amyotrophic lateral sclerosis
                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                   cytostatic, haemostatic, neuroprotective; antihemmatic; antiarthritic; antibacterial, anti-HIV; hepatotropic; virucide; exocytosis; antibacterial, anti-HIV; hepatotropic; virucide; exocytosis; antihelammatory; apical endocytosis; basolateral endocytosis; ADA-SCID; transcytosis; monogenic disease; ADA deficiency; cystic fibrosis; ADS, X-linked severe combined immunodeficiency; Haemophilia B; cancer; HIV; amyotrophic lateral sclerosis; rheumatoid arthritis; hepatitis; Herpes; pathogenic disorder; human immunodeficiency virus; bacterial infection; tuberculosis; Chiamydiosis; gastrointestinal ulcer; p19R;

(I) has immunostimulant, cytostatic, haemostatic, neuroprotective, antirheumatic, antiarthritic, antilbacterial, anti-HIV, hepatotropic, virucide and antiinflammatory activities, and can be used in gene therapy. (I) confers the ability to undergo apical endocytosis, basolateral endocytosis, apical or basolateral transcytosis and
          immunodeficiency virus (HIV), viral infections, hepatitis, non-specific bacterial infection, tuberculosis, Herpes, Chlamydiosis and gastrointestinal ulcer. The present sequence represents a polyimmunoglobulin receptor (pigR) amino acid sequence which is given in the exemplification of the present invention

basolateral to apical transcytosis. Diseases treatable by gene therapy include monogenic diseases such as X-linked severe combined immunodeficiency, ADA deficiency (ADA-SCID), cystic fibrosis, Haemophilia B, chronic granulomatous disease, cancers such as ovarian cancer, other diseases such as coronary artery disease, amyotrophic lateral sclerosis (ALS), rheumatoid arthritis, pathogenic disorders, including human immunodeficiency virus (HIV), viral infections, hepatitis, non-specific bacterial infection, tuberculosis, Herpes, Chlamydiosis and gastrointestinal ulcer. The present sequence represents a polyimmunoglobulin receptor (PIGR) amino acid sequence which is given in the exemplification of the present invention

Fusion protein which confers the ability to penetrate epithelial layer and to undergo paracellular transport, has a transepithelial delivery element and a transmembrane domain from different proteins.

Disclosure; Fig 2B; 160pp; English

The present invention describes a fusion protein (I) comprising a transepithelial delivery element (TDB) from a first protein and a transmembrane domain from a second protein, or comprising TDB and a viral sequence that confers the ability to be associated with or incorporated into an envelope or capsid protein of a virus. (I) has immunostimulant,

```
antinflammatory activities, and can be used in gene therapy. (I) confers the ability to undergo apical endocytosis, variation and can be used in gene therapy. (I) confers the ability to undergo apical endocytosis, basolateral endocytosis, apical or basolateral exocytosis, apical to basolateral transcytosis and basolateral to apical transcytosis. Diseases treatable by gene therapy include monogenic diseases unch as X-linked severe combined immunodeficiency, ADA deficiency (ADA-SCID), cystic fibrosis, Haemophilia B, chronic granulomatous disease, cancers such as ovarian cancer, other cancers such as coronary artery disease, including human cancer, other immunodeficiency virus (HIV), viral infections, hepatitis, non-specific bacterial infection, tuberculosis, Herpes, Chlamydiosis and gastrointestinal ulcer. The present sequence represents and gastrointestinal ulcer. The present sequence represents a colonium receptor (FIGR) amino acid sequence which is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The present invention describes a fusion protein (I) comprising a transepithelial delivery element (TDE) from a first protein and a transembrane domain from a second protein, or comprising TDE and a viral sequence that confers the ability to be associated with or incorporated into an envelope or capsid protein of a virus. (I) has immunostimulant, cytostatic, hambacteric, antitheumatic, antiarthritic, antiulcer. antibacterial, anti-HIV, hepacotropic, virucide and antinflammatory activities, and can be used in gene therapy. (I) confers the ability to undergo apical endocytosis, basolateral endocytosis, apical to basolateral transcytosis, apical to basolateral transcytosis. Diseases treatable by gene therapy include monogenic diseases such as X-linked severe combined immunodeficiency, ADA deficiency (ADA-SCID), cystic fibrosis, Haemophilia b, chronic granulomatous disease, amyotrophic lateral sclerosis (ALS), rheumatoid arthritis, pathogenic disease, amyotrophic lateral sclerosis (ALS), rheumatoid arthritis, pathogenic disease, including human (munodeficiency virus (HIV), viral infections, hepatitis, non-specific gastrointestinal ulcer. The present sequence represents and given in the exemplification of the present invention Sequence 243 AA;

Fusion protein which confers the ability to penetrate epithelial cell

layer and to undergo paracellular transport, has a transepithelial delivery element and a transmembrane domain from different proteins

Disclosure; Fig 2B; 160pp; English.

The present invention describes a fusion protein (I) comprising a transmembrane domain from a second protein, or comprising The transmembrane domain from a second protein, or comprising The and a viral sequence that confers the ability to be associated with or incorporated into an envelope or capsid protein of a virus; (I) has immunostimulant, cytostatic, hamenostatic, nationatic, antitheumatic, antiarthritic, antinflammatory activities, and can be used in gene therapy. (I) confers the ability to undergo apical endocytosis, basolateral endocytosis, apical or basolateral exocytosis. Diseases treatable by gene therapy confined monogenic diseases with as X-linked severe combined immunodaticiency, ADA deficiency (ADA-SCID), cystic fibrosis, Haemophilia cimclude monogenic diseases, cancers such as ovarian cancer, other immunodeficiency as coronary artery disease, amyotrophic lateral sclerosis (ALS), rheumatoid arthritis, pathogenic diseorders, including human communodeficiency virus (HIV), viral infections, hepatitis, non-specific manunodeficiency virus (HIV), viral infections, hepatitis, non-specific dasterial infection, tuberculosis, Herpes, Chlamydlosis and communogalobulin receptor (FUGR) amino acid sequence which is given in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                                                                     셤
                                                                                                                                                                  The present invention describes a fusion protein (I) comprising a transepithelial delivery element (TDE) from a first protein and a transmembrane domain from a second protein, or comprising TDE and a viral sequence that confers the ability to be associated with or incorporated into an envelope or capsid protein of a virus. (I) has immunostimulant, orforestic, haemostatic, naturely, entritheumatic, antiatrhritic, antialcer, antibacterial, anti-HIV, hepatoropic, virucide and antiatrhritic, antinflammatory activities, and can be used in gene therapy. (I) confers the ability to undergo apical endocytosis, basolateral transcytosis, apical or basolateral transcytosis.)

The ability to undergo apical endocytosis, basolateral transcytosis and basolateral to apical transcytosis. Diseases treatable by gene therapy include monogenic diseases such as X-linked severe combined include monogenic diseases such as X-linked severe combined inmunodeficiency, ADA deficiency (ADA-SCID), cystic fibrosis, Haemophilia B, chronic granulomatous disease, amyotrophic lateral sclerosis (ALS), rheumatoid arthritis, pathogenic diseases such as ovarian cancer, other immunodeficiency virus (HIV), viral infections, hepatitis, non-specific pacterial infection, tuberculosis, Herpes, Chlamydiosis and gastrointestinal ulcer. The present sequence represents a connecent in east of seases of seasolateral sequence represents a polynmunoglobulin receptor (PIGR) amino acid sequence which is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Dahl E;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     toxin receptor protein consisting of a toxin receptor protein linked to at least a portion of an immunoglobulin heavy chain with a J (joining) chain and secretory component (SC) associated with the chimeric toxin receptor protein. The immunoadhesin comprises a chimeric bacterial or viral toxin receptor protein and the immunoadhesin has plant-specific glycosylation. The immunoadhesin of the invention demonstrates virucide
                                                                 activity. The sequences are also useful in producing pharmaceutical compositions for treatment of pancreatic tumors. AAY73814-Y74252 represent protein fragments encoded by the human pancreatic tumor cDNA library derived expressed sequence tag (BST) sequences represented in AAZ52858-Z53014
                                       This invention describes novel polypeptides and their encoding nucleic acids derived from human pancreatic tumor tissue which have cytostatic
                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               immunoadhesin; immunoglobulin heavy chain; J chain; joining; toxin; virucide; antibacterial; anthrax; rhinovirus infection; common cold; intercellular adhesion molecule; ICAM-1; human; plasmid pSHuSC;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel immunoadhesin comprising a chimeric

The sequence is that of the secretory component of human secretory immunoglobulin A (sigA). It can be used as part of a method for the production of sig molecules. This method is useful for producing commercial quantities of sig (especially sigA) to treat or prevent infections. In particular, sigA produced by the method can be used to prevent or treat infections at a mucosal surface. It is especially useful to prevent or treat infections at a mucosal surface. It is especially useful to prevent or treat infection with human immunodeficiency virus (HIV), respiratory syncytial virus, flu virus or cold virus. The method allows production of commercial quantities of sig molecules for therapeutic use, not previously possible; production using non-plant cells and a single cell type is more efficient than a previous multi-step process of fusing recombinant plant cells, and avoids alterations of the sig by plant cells. SigA molecules are more stable and resistant to previent as well as to treat infections, unlike e.g. IgG and IgM coprevent.
and antibacterial activities and may be useful for reducing the binding of a viral or bacterial antigen to a host cell and thus for treating or preventing anthrax, as well as human rhinovirus infection which results in the common cold. The current sequence is that of the human immunoadhesion-related protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Producing secretory immunoglobulin in single cells - useful to produce commercial quantities of secretory immunoglobulin to prevent or treat
                                                                                                                                                                                     Gaps

The method comprises: (a) transforming the cells with several naked plasmids each encoding some, but not all, of the polypeptide components of the multimeric proteins, and together providing all the polypeptide components; and (b) culturing the cells. The method is used to produce biologically active multimeric proteins particularly immunoglobulins, receptor: Ignad complexes, homo- or hetero-dimeric receptors, or trimeric G proteins. This method provides properly associated and assembled multimeric proteins in a fast and efficient process, without the need to cross plants expressing single component of the protein. Transgenic plants containing adjacent and stably integrated plasmids, and their progeny can also express the multimeric proteins. The present sequence represents the partial amino acid sequence of the
                                                                                                                                                                                                                                                                                                                                                                                                                         Producing heterologous multimeric proteins in plants, transformed with several plasmids expressing polypeptide components, particularly for immunoglobulins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                  25-MAR-2004.
ABM84869;
The invention relates to an immunoadhesin comprising: (a) a chimeric intercellular adhesion molecule (ICAM)-1 comprising a rhinovirus receptor protein linked to at least a portion of an immunoglobulin heavy chain, and (b) optionally a J chain and secretory component associated with the chimeric ICAM-1 molecule. The immunoadhesin has plant-specific olycosylation and virucide activity. The immunoadhesin is useful for reducing infection by human rhinovirus (HRV) and hence the initiation or spread of the common cold by HRV. The immunoadhesin binds to HRV and reduces its infectivity, competing with cell surface ICAM-1 for binding infecting with virus entry or uncoating and directing premature release of viral RNA and formation of empty capsids. Expression of the immunoadhesin having multiple binding sites have a higher effective affinity for the virus, thereby increasing the effectiveness of the immunoadhesin. Association of secretory component and immunoglobulin chain increases the stability of the immunoadhesin in the mucosal chain increases the stability of the immunoadhesin in the mucosal canimal cell culture and production in plants is safer for human use, since plants are not known to harbor any animal viruses. The present animal of the human secretory component expressed from the constant and admining the constant of the human secretory component expressed from the
                                                                                                                                                                                                                                                                                                                                                                                                                            Immunoadhesin for treating human rhinovirus infection comprises chimeric intercellular adhesion molecule-1, and optionally a J chain and secretory

The invention relates to novel diagnostic and therapeutic polynucleotides

selected from one of the 272 sequences defined in the specification. A

polynucleotide of the invention may have a use in gene therapy. The human

cused to diagnost a particular condition, disease or disorder associated

with human molecules, e.g. cell proliferative disorders,

cutoimmus/inflammatory disorder, developmental disorders, or

disorder, neurological disorders, gastrointestinal disorders, or

infections caused by virus, bacteria, fungi or parasite. The dithp

condicules may also be used in genetic mapping, in identifying individuals

from minute biological samples, in detecting single nucleotide

polymorphisms, as molecular weight markers, and for somatic or germline

polymorphisms, as sequence represents a dithp protein of the

invention. Note: The sequence data for this patent is not represented in

the printed specification, but was obtained in electronic format directly

from WIPO at www.wipo.int/pct/en/sequences/listing.htm

The invention relates to novel diagnostic and therapeutic polynuclectides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnost a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine of usorder, neurological disorder, developmental disorder, or caused by virus, bacteria, fungi or parasite. The dithp inflammators also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline invention. Note: The sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                         Schmidt JP, Wright RJ, Bruns CM, Marjanovic MM, Shen F;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 4, Application US/09982107

Patent No. US20020159958A1

GENERAL INFORMATION:

APPLICANT: HIATT, ANDREW C.

APPLICANT: HIATT, MICH B.

TITLE OF INVENTION: METHODS FOR PRODUCING IMMUNOGLOBULINS CONTAINING

TITLE OF INVENTION: METHODS FOR PRODUCING IMMUNOGLOBULINS CONTAINING

TITLE OF INVENTION: METHODS FOR PRODUCING IMMUNOGLOBULINS CONTAINING

FILE REPERENCE: EP13002E

CURRENT PFLING DATE: 2001-10-16

NUMBER OF SEQ ID NOS: 19

SEQ ID NO 4

LENGTH: 746
                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
